

Exploratory Graphics

What is the genome length of astrovirus?

The astrovirus genome is approximately 6 to 8kb in length.

Diagnostic plot to estimate min-length filter for phylogenetic analysis (all data = 16381)

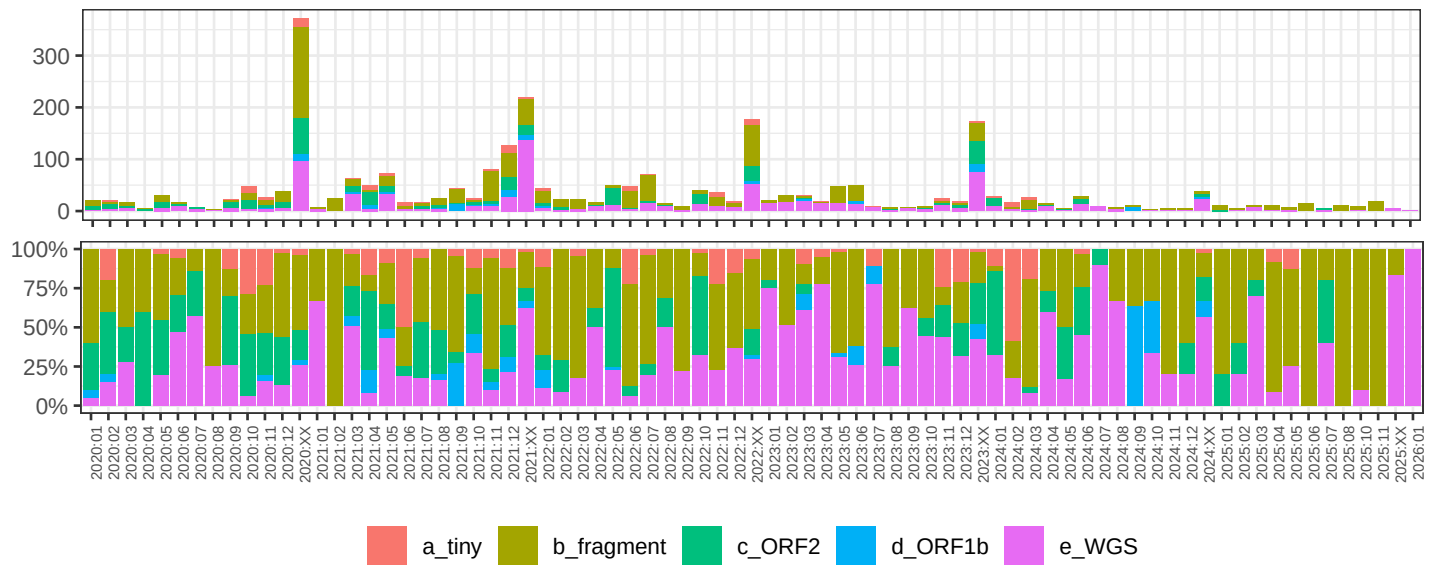

What is the distribution by length and host type?

```
cdata <- data %>%
  subset(., !is.na(date)) %>%
  subset(., date != "XXXX-XX-XX") %>%
  mutate(
    date_adjusted = lubridate::date(gsub("-XX", "-01", date)),
    col_year = substr(date, 1, 4),
    col_mon = substr(date, 6, 7),
    col_day = substr(date, 9, 10),
    len_category = case_when(length > 4000 ~ "e_WGS",
                             length > 1700 ~ "c_ORF2",
                             length > 1000 ~ "d_ORF1b",
                             length > 300 ~ "b_fragment",
                             TRUE ~ "a_tiny"),
    host_category = case_when(host %in% c("Homo sapiens") ~ "Z_Human",
                              is.na(host) ~ "NA",
                              TRUE ~ "A_Other"),
    host_length = paste0(host_category, "_", len_category)
  )

diagnostic_time_fill_plot_month(
  subset(cdata, col_year > 2019),
  margin_l=0.5, fill="len_category"
)
```

Frequency and proportion (n=2731)

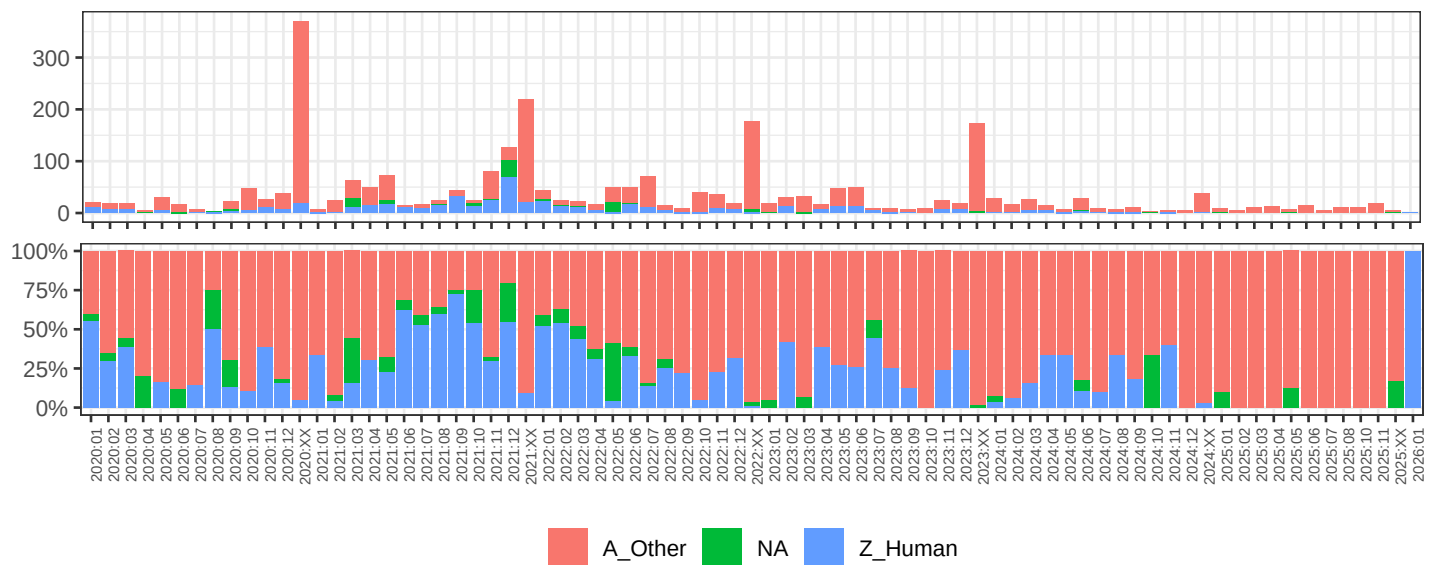

```
cdata %>% filter(col_year > 2019) %>% group_by(len_category) %>% summarise(n = n(), .groups = "drop")
```

```
## # A tibble: 5 x 2
##   len_category    n
##   <chr>        <int>
## 1 a_tiny       185
## 2 b_fragment   1103
## 3 c_ORF2       484
## 4 d_ORF1b     123
## 5 e_WGS       836
```

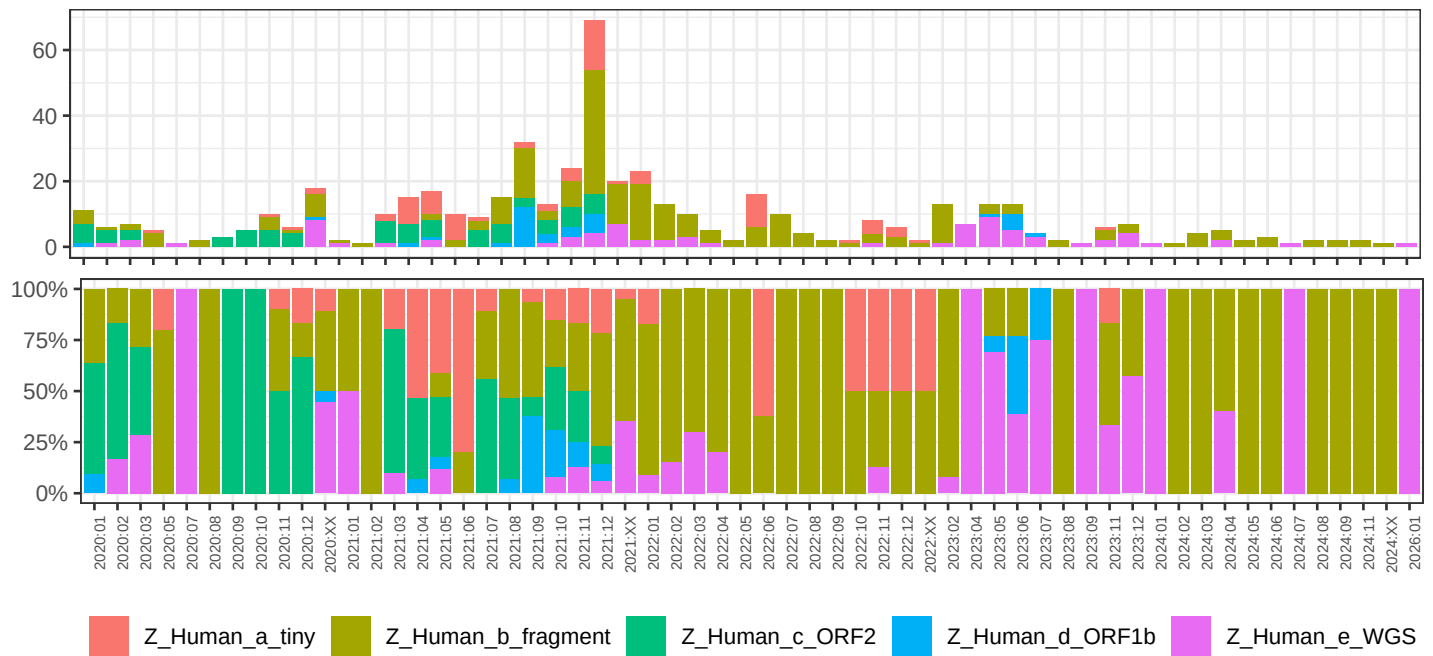

```
